Daybreak Website Spec (v1 Handoff)

Nov 9, 2026 · @Cameron

A complete description of datadoesnotlie.com as built, every section, element, and animation, written so another builder can recreate or redesign it without seeing the code.

1. What this is

The live site is datadoesnotlie.com, the marketing site for Daybreak, the AI-powered CRM for retail, by Data Does Not Lie (DDNL). It is a single self-contained `index.html` (~2MB, video and images base64-inlined) plus `blog.html`, `blog-construction-case-study.html`, `privacy.html`, `terms.html`, an `assets/` folder, and an SEO layer (`robots.txt`, `sitemap.xml`, `llms.txt`). No build step, no framework: hand-written HTML/CSS with vanilla JS for every animation. Hosted on Netlify, auto-deployed from GitHub repo `patalanocameron-ui/DataDoesNotLie-Final` (main branch).

The design brief it was built to: a high-tier, human-designed product site in the feel of Linear. One sans family, strict type scale, 1px hairline dividers instead of heavy cards, generous whitespace, no neon gradient slop, no floating blobs, no emojis, every number in a mock set in a monospace font. Everything animated is purposeful: product mocks demonstrate the product doing its job, triggered once on scroll, and every animation has a reduced-motion fallback.

Page order on the homepage: sticky nav → hero (wordmark + headline + video) → feature strip → How it works (5 steps) → AI advisory (interactive) → Workflows → Who it's for → Services → Use cases → About the founder → FAQ → Demo form → footer.

2. Design system

Colors (CSS custom properties on :root):

Token	Value	Use
--bg	#081C30	page background, deep navy
--surface	#0B2540	mock/card surfaces
--accent	#2BE39B	mint: CTAs, highlights, chart bars, live dots

Token	Value	Use
--amber	#F2A93B	warnings, warm tags (Lapsed VIP chips)
cyan pair	#7CE0FF, #52B9E9	gradient partner to mint, secondary chart color
--text	#EAF3F9	primary text (soft white)
--text-dim	~rgba(234,243,249,.72)	body copy
--text-faint	low-opacity white	labels, metadata
--border / --border-strong	rgba white ~.09/.16	1px hairlines everywhere

Accent gradient (used sparingly: top bars, logo ring): `linear-gradient(90deg,#2BE39B,#52B9E9)`. Light surfaces exist only inside the advisory card (white #fff card with ink #0E2A47).

Type: Instrument Sans (Google Fonts, weights 400/500/600) for everything; JetBrains Mono for numbers, labels, kickers, and all text inside product mocks. Mono labels are small (0.55-0.72rem), uppercase, letterspaced (.08-.16em). H1 is huge and task-describing, letter-spacing -0.02em. No font weight above 600 except the wordmark (700 mono).

Components: buttons (.btn-primary mint with dark text, .btn-secondary 1px border transparent bg, radius ~10px); pill badges; chips (rounded-full, 1px border); cards are border-first (1px line, radius 12-16px, surface fill, almost no shadow); section pattern = mono kicker label, H2, one-sentence .lede in dim text; 1px divider rows instead of boxed grids where possible; tooltips on dotted-underline terms (the MCP badge); skeleton loaders with shimmer.

Motion rules: ease curves `cubic-bezier(.2,.8,.25,1)` for slides/grows and `cubic-bezier(.34,1.56,.64,1)` for pops (slight overshoot); durations 300-700ms; stagger steps 50-150ms; everything fires once via IntersectionObserver, no looping except the chat demo and skeleton shimmer; `prefers-reduced-motion` disables every animation and shows final states instantly.

3. Global chrome and animation systems

Nav: sticky top bar, navy with hairline bottom border. Left: the Daybreak logo (a donut chart ring in navy/mint/red/amber segments with a mint rising-sun in the hole, transparent-background PNG, 30px) next to "Data Does Not Lie" in white 600. Links: How it works, AI advisory, Workflows, Services, Use cases (→ blog.html), About. Right: mint "Get a demo" button. Logo lifts 1px on brand hover.

Footer (every page): hairline top border; left "**Data Does Not Lie** · Your data already knows. Now it tells you."; center nav: Home, Use cases, About, Get a demo, Privacy, Terms; right "© 2026 Data Does Not Lie".

Animation system 1, section reveals: every major block carries `data-reveal`; an IntersectionObserver adds `.revealed` once at ~20% visibility, fading/raising the block (opacity 0→1, translateY ~14px→0, ~600ms). Under reduced motion or no IO support, everything gets `.revealed` immediately.

Animation system 2, mock choreography: product mocks carry `data-anim`; a second observer adds `.anim` at 30% visibility, once. CSS transitions inside each mock are gated on `.anim` with per-element `--delay` custom properties, producing scripted sequences (detailed per section below).

Animation system 3, counters: elements with `data-count` (plus optional `data-decimals`, `data-prefix`, `data-suffix`) count from 0 to target over ~1.25s with cubic ease-out when their mock gets `.anim`, formatted with locale commas (47,996) or decimals ($2.84M, 33.8%). Static HTML holds the final value as fallback.

JS inventory (all vanilla, inline at the bottom of index.html): reveal observer; mock-anim observer + counters; hero typewriter; advisory sketch toggle; 3-turn chat demo; FAQ is pure `<details>/<summary>`; lead form posts to Google Forms.

4. Hero and feature strip

Hero (centered column):

1. **Logo + wordmark lockup:** the donut-sunrise logo (~58-84px, soft mint drop shadow) above DAYBREAK in JetBrains Mono 700, solid white #fff, letter-spacing .18em, size clamp(2.3rem, 6vw, 3.6rem). On load, a JS typewriter types D-A-Y-B-R-E-A-K one character every 115ms starting at 450ms, with NO cursor/caret (explicitly removed). Below it: "BY DATA DOES NOT LIE" in mono .64rem, letter-spacing .3em, faint grey.
2. **H1:** "Upload your data. Know exactly what to do next."

3. **Sub:** "Connect Square or upload a CSV. Daybreak turns your sales data into clear reports, plain-language recommendations, and email and SMS follow-up that runs itself."
4. **CTAs:** mint "Get a demo" (→ #demo) + bordered "See how it works" (→ #how).
5. **Hero video:** base64-inlined MP4, autoplay/muted/loop/playsinline, rounded border frame. Content: a 45-second product tour showing data-source options (Square, custom API, CSV upload) then reports, customer tags, an AI recommendation, and a win-back workflow building themselves. Caption under it in mono: "45-second product tour · Illustrative demo data".

Background: subtle radial mint glow bleeding from the top, gradient accent hairline (mint→cyan) across the very top of the page.

Feature strip: directly under the hero, a 4-across row divided by 1px vertical hairlines (no card boxes). Each item = bold white line + dim one-liner:

- **Square or CSV** / Connect live or upload any export
- **Tag and save views** / Your whole team sees the same list
- **Daily recommendations** / What changed, why, and what to do
- **One-click follow-up** / Email and SMS workflows, opt-outs handled

Collapses 4→2→1 columns at 860px/480px, swapping vertical dividers for horizontal ones.

5. How it works (section #how)

Header: kicker label, H2 "From a CSV to customers walking back in", lede "Five steps, no setup project, no analyst required. The same flow you see in the video above." Five rows follow, each a 2-column grid (text 5fr / mock 7fr), alternating sides via a `.flip` class, separated by 1px top borders. Text side = oversized faint mono step number (01-05), H3, paragraph, small `.how-note` footnote. Mock side = a dark `.ui` panel (surface #0B2540, 1px border, radius, header strip with mono kicker + title + right-aligned meta). All numbers in mocks are mono. A footnote under the section: "All numbers and customers shown are illustrative demo data."

01 · Connect or upload your data. Copy: Square syncs on its own, or drop in any CSV; Daybreak detects and maps columns; note mentions API connection for an additional setup charge. Mock: an import pill "Imported orders_2026.csv" with a mint ✓ disc and a row counter "47,996 rows", above three column-mapping rows (their column → our field,

e.g. cust_name → Customer). **Animation:** pill fades up, ✓ pops with overshoot at .35s, row count ticks 0→47,996, then each mapping row slides in from the left (.55/.75/.95s) and its → arrow turns mint .3s later.

02 · Reports build themselves. Copy: a Sales Overview appears instantly, with Customers/locations/channels reports behind it; numbers keep refreshing. Mock: "Auto-generated report · Sales Overview" with a LIVE dot, four KPI tiles (Revenue $2.84M, Orders 48,212, Avg order $58.91, Repeat rate 33.8% in amber), a 12-bar monthly revenue chart, then an "Also generating" row of two skeleton cards with shimmering bars. **Animation:** KPI tiles stagger up (.05-.35s) while all four numbers count up; the 12 bars grow from the baseline left→right (scaleY, .45→1s); "Also generating" fades in at 1.15s; skeletons shimmer forever.

03 · Filter, tag, and save views. Copy: filter by location or date, select the customers a question surfaces, tag them once, save the view for the team. Mock: "Downtown · Last 90 days · Customers", two mint filter chips ("Last order > 60d", "Top 20%"), four customer rows (M. Chen, R. Patel, S. Okafor, D. Rivera) each with checkbox, spend figure, and an amber "Lapsed VIP" tag chip, footer "Tag → 312 customers tagged Lapsed VIP". **Animation:** chips pop (.1/.25s), rows slide up staggered (.4-.76s), each ✓ springs in ~.5s after its row, amber tags fade in after that, footer appears at 1.65s with the 312 counting up.

04 · The AI tells you what to do. Copy: every morning Daybreak reads your numbers and flags what deserves attention, in plain language with the evidence behind it. Mock: a compact WHITE advisory card (the one light element on the page): ADVISE stamp, mono "DAILY RUN · 06:00", headline "Downtown's repeat customers are slipping", WHAT CHANGED block ("Repeat rate fell to 26.0% over the last 90 days, 8 points under its 12-month average."), then two chips: mint "Create win-back workflow →" and bordered "Dismiss". **Animation:** stamp → headline → evidence block → action chips build in sequence (0/.15/.35/.85s).

05 · Workflows act on it. Copy: one click turns the recommendation into a live email/SMS workflow and enrolls matching customers. Mock: "Win-back · Lapsed VIPs" with three nodes on a vertical mint connector line: Trigger / "Tag added: Lapsed VIP" / "312 match"; Email / "We saved your spot: 15% off" / "Now"; Wait + SMS / "2 days later, skip if they order" / "Day 2"; then a result pill "✓ Workflow live · 312 contacts enrolled". **Animation:** the connector line draws downward (scaleY .9s), nodes stack in at .2/.45/.7s, result pill pops with overshoot at 1.05s.

6. AI advisory (section #advise), the interactive centerpiece

Header: kicker "The AI advisory layer", H2 "Advice that shows its work", lede "Not a dashboard you have to decode. An advisor that reads your real numbers every day, speaks plainly, and answers what you ask." Left column: four mono-labeled steps (Watch / Explain / Recommend / Prove) each with a line of copy. Right column: the flagship advisory card.

The advisory card (white, interactive): full version of step 04's card: ADVISE stamp + VIA MCP badge (dotted underline, hover tooltip explaining MCP), DAILY RUN timestamp, headline "Downtown's repeat customers are slipping", three labeled blocks (What changed / Why it matters: "312 high-value customers haven't ordered in 60+ days. At $410 a year each, about $128K is at risk." / Recommended action), action chips "Create win-back workflow →" (a real button) and "Dismiss with reason", footer source line "grounded in: orders_2026.csv · view: Lapsed VIPs · Downtown · illustrative demo data".

Clicking "Create win-back workflow" runs the workflow sketch: the card's heading swaps to "Win-back workflow · Lapsed VIPs", the recommendation content hides, and an SVG flowchart draws itself node by node on the white card (ink-on-paper look, 1.4px strokes, arrowheads, rounded-rect nodes with mono kicker + label): Trigger (Tag added: Lapsed VIP) → Email (We saved your spot) → wait-2-days pill on the connector → "Ordered?" diamond → YES goes right to a green GOAL REACHED node (Customer ordered · exit), NO continues down → SMS (15% code · opt-outs handled) → wait-3-days pill → second "Ordered?" diamond → YES elbows up into the same goal node, NO drops to a FALLBACK node (Pause + flag for review). Each node pops and each connector draws (stroke-dashoffset) on a timed cascade from 0 to ~3.2s; YES labels are green, NO labels amber. At ~3.5s a footer appears: "✓ Workflow live · 312 Lapsed VIPs enrolled" with an "↺ Back to the recommendation" link that restores the card. Implementation detail that matters: the sketch needs a two-phase class (`display` first, then a rAF-delayed `drawing` class) or all transitions fire at once.

"Talk to your data" row (below the grid, same section): text side explains asking in plain English over MCP; the note tells visitors the demo is clickable. Mock side is a realistic chat window:

- **Header:** gradient avatar tile (mint→cyan rounded square) containing a small drawn sunrise glyph, "Daybreak" + glowing green dot + "Online · connected over MCP", right-aligned "AI analyst".
- **Three scripted conversations** in one frame: (1) "What are our Q4 profit projections?" answered with "$412K, up 9% on Q3" plus a 6-month combo chart (Jul-Sep actual bars in dim cyan, Oct-Dec projected in mint gradient, dollar gridlines, value labels, a trend

line that draws across bar tops with dots and a glowing end marker, legend, "▲ 9% vs Q3" badge, "Q4 total · $412K"); (2) "Break it down by store" answered with horizontal bars (Downtown $176K / Westside $134K / Mall kiosk $102K); (3) "What's driving December?" answered with mint contribution bars (+$9.8K holiday gifting, +$4.6K win-backs, +$1.6K organic, note "Gift cards at 2.1x their November average").

- **The play loop:** the question types character-by-character into the input bar (caret blinking, send button brightening), sends with a button pulse, appears as a right-aligned mint-tinted bubble with "You · just now", a typing-dots bubble shows under the avatar for ~1.1s, then the answer card slides in under "DAYBREAK · AI ANALYST" with its chart animating (bars grow staggered, line draws, labels fade) and a source row "VIA MCP · orders_2026.csv · ...". After ~6.5s it auto-advances to the next conversation.
- **Interactive paths:** after each answer, pill buttons for the other two questions fade in; clicking one jumps the queue and plays that conversation immediately. The current conversation's own chip hides. Thread height is locked (~552px) so the frame never jumps between answers.

7. Workflows, personas, services, use cases, about

Workflows (section #workflows): H2 "From "we should follow up" to followed up", lede about recommendations ending in action. Mock: the same Win-back · Lapsed VIPs node stack as step 05 at full size (trigger / email / wait+SMS nodes on a drawing mint connector, "✓ Workflow live · 312 contacts enrolled" result), with supporting copy about waits, skip-if-they-order rules, automatic drop-out on purchase, and opt-out handling on every text.

Who it's for (section #teams): H2 "Built for the people who run the store". Three persona cards (mono role kicker, bold claim, body): **Owners** / "Know where you stand in one glance" / revenue-orders-repeat across locations, "the morning gut-check, without the spreadsheet"; **Operators & managers** / "Catch problems while they're small" / slipping location, quiet weekday, cold channel, "hands you the fix, not just the chart"; **Marketing** / "Send to the right people, automatically" / real segments from real purchases, tag once and workflows do the rest. Below: "Sound familiar?" pain list, four items each with a bold line + dim sub-line (data stuck in the register; reports take hours and still don't say what to do, "a chart is not a decision"; good customers slip away before anyone notices; follow-up only happens when someone remembers).

Services (section #services): H2 "Three ways to work with us". Grid 7fr/5fr. Left, the big **Daybreak** tile: "Key offering" kicker, Daybreak title with "BY DATA DOES NOT LIE" lockup, the donut-sunrise logo small in the top-right corner (44px), seven bullets (direct Square integration or CSV upload; reports build themselves; filter/tag/save views; daily AI recommendations; one-click email+SMS; connects to existing tools; API connection for an additional setup charge), "Get a demo" button, and a tilted (-3°) product screenshot panel bleeding off the bottom-right corner: a mini Sales Overview with KPIs, a full-height mint bar chart with a trend line that draws itself with an arrowhead, and two donut charts (channel mix, customers repeat/new). The tilted shot straightens slightly on hover; it is desktop-only, hidden under 860px. Right column, two stacked tiles: **Custom Development** (bespoke apps, dashboards, integrations, AI assistants on the company's own data) and **Website Development** with a mint "AEO built in" badge (fast marketing sites, SEO plus answer-engine optimization, bullet highlighting that AI assistants can find and quote the business, closing line "This site is one.").

Use cases (section #usecases): H2 "Real work, written up", link to blog.html. One real card: "Replacing a Spreadsheet That Ran a Construction Company" with a banner image, Custom Development tag, dek, and a stat strip (8-10 hrs saved weekly · 270/270 tests passing · 633 reports generated), linking to the case-study page (byline Cameron Patalano · Data Does Not Lie, dark-themed article with real dashboard screenshots). Next to it a dashed-border "More use cases on the way" placeholder card.

About (section #about): "About the founder" label, photo left (640px headshot, rounded, 1px border, soft shadow, max 240px on mobile), three paragraphs: founder and author Cameron Patalano building tools that help small businesses automate with ease; CRM background (HubSpot, GoHighLevel, owned Revenue Rebranded which sold a white-label HighLevel, independent CRM contracting); AI & Automation advisor at Stature Advisors developing custom software and implementing AI systems at scale; built Daybreak after seeing the retail gap; author of Radical Transparency. Two bordered link buttons: the book on Amazon, LinkedIn. Person schema in JSON-LD ties him to the Organization as founder.

8. FAQ, demo form, legal, SEO/AEO

FAQ (section #faq): H2 "Common questions". Seven native `<details>/<summary>` accordions with a +/- indicator, hairline dividers: What is Daybreak? / What data sources does Daybreak support? (Square out of the box, CSV with auto column detection, almost any other system by API such as the SPOT dry-cleaning POS for an additional setup charge) / Do I need an analyst? / What does the AI actually do? (daily reads, dollar-impact explanations, cites its data, and over MCP builds reports, workflows, smart lists, email

templates, SMS snippets) / Can Daybreak send email and SMS? (one-click workflows, waits and skip rules, auto drop-out, opt-outs on every text) / What does Daybreak cost? (walked through on the demo call; Square and CSV turnkey, API setups carry a charge) / Who is behind Daybreak? The same Q&A pairs are mirrored as FAQPage JSON-LD.

Demo form (section #demo): H2 "See your own data tell the truth", lede "On Square, we'll connect your store live. Otherwise bring a sales export...". Fields: name, work email, company, optional message; mint submit button. Submission POSTs headlessly (no-cors) to a Google Form ("Daybreak Demo Requests", form id 1FAIpQLSfa9CtHvBQI-y2EgTQ2nXJ-xQbM8VJCfgtkZCV927HiXuhjNQ; entry ids name=91645865, email=492368119, company=497609646, message=259026376), then swaps in an inline success state. Verified working end to end.

Legal: privacy.html and terms.html share the site chrome with a narrow prose column. Privacy includes an email opt-in/unsubscribe section and an A2P-compliant SMS section (STOP/HELP, frequency varies, msg & data rates, and the carrier-required line that no mobile opt-in data is shared with third parties for marketing). Terms cover the three services, customer data ownership, messaging-compliance responsibility, an AI-recommendations disclaimer, Florida law, 12-month liability cap. Both linked in every footer.

SEO/AEO layer: unique titles/descriptions/canonicals per page; OG + Twitter cards (og-home.jpg, case-study OG image); JSON-LD @graph on the homepage (Organization with the Daybreak logo, Person founder, WebSite, SoftwareApplication "Daybreak", FAQPage) and Article + BreadcrumbList on the case study; robots.txt explicitly welcoming GPTBot, ClaudeBot, PerplexityBot, OAI-SearchBot, Google-Extended; sitemap.xml (home, blog, case study, privacy, terms); llms.txt summarizing the company, product, services, and pages in plain language for AI crawlers. Site verified in Google Search Console (HTML file google7bffc4ca45ad5fa4.html must stay at the root), sitemap submitted, key pages indexed.

9. Assets, behavior rules, and what the new version must keep

Assets (in /assets): daybreak-logo.png (the donut-sunrise mark, transparent background, used as nav brand, favicon, hero mark, Daybreak-tile corner mark, and Organization logo in schema); cameron-patalano.jpg (founder headshot); og-home.jpg and case-study-construction-og.jpg (share images); ddnl-mark.png (retired old logo, still in the repo). The hero video and all case-study screenshots are base64-inlined in their pages.

Naming rules: the product is always "Daybreak" with "BY DATA DOES NOT LIE" in small letterspaced mono beneath it. Tagline: "Your data already knows. Now it tells you." Daybreak descriptor: "The AI-powered CRM for retail." Segment vocabulary (never use competitor-flavored names): VIPs, Regulars, VIP Gone Quiet, Regular Gone Quiet, Encore 1-3, Bounce Back 1-3, Lost Whale, Lost Tuna, Lapsed VIP.

Copy rules: Square is the only named direct integration (plus CSV upload, plus "we can connect via API to almost any database for an additional setup charge"). Every mock is labeled illustrative demo data. No em dashes in user-facing copy. Plain language over jargon everywhere ("What changed / Why it matters", never "KPI variance").

Behavior rules: all animations fire once on scroll (chat demo and skeletons are the only loops); every animation has a `prefers-reduced-motion` static fallback; mobile (≤860px) stacks all grids to one column, hides the tilted Daybreak product shot, keeps 16-24px side gutters with no horizontal scroll, and keeps both headline lockups on single lines; mocks never use real customer data.

Known gaps for the new version to improve: the hero video still shows Shopify as an option even though copy is Square-only; pricing is demo-call-only by design; the blog has one real case study plus a placeholder; the chat demo is scripted, not live.
